Jubatus is the first distributed online machine learning technology in the world. Jubatus learns a rule (Deep analysis) by analyzing complex and large data (Big data) quickly (Real-time) without data accumulation. If you want to analyze more large data, Jubatus can achieve the goal by simply adding low cost servers.

Features
- Big data: Analyze complex and large data such as surveillance camera, sensor data.
- Deep analysis: Learn rules from a case such as image recognition which needs complex recognition.
- Real-time: Quick response without data accumulation.
- Scalable: Scale out by adding low cost servers.

Application Scenarios
- Human action recognition for smart surveillance camera
- Anomaly detection and prediction from streaming data collected by sensors
- Market investigation from social media analysis

Co-Innovation
Joint development with Preferred Infrastructure
NTT software launched commercial support system.
