Abstract

By collecting longitudinal/cross-sectional vocabulary data in atypically developing children, our study provides evidence that atypically developing children as well as typically developing children show a vocabulary spurt and tend to acquire similar words at earlier stages of lexical development.

Features

- Clarifying the characteristics of vocabulary spurt in late talkers
- Proposing new analysis of child vocabulary development

Application Scenarios

- Language acquisition science
- Pediatric medical fields
- Picture book recommendation

Collaboration Partner

Takeda General Hospital, The University of Electro-Communications.

We collected and analyzed longitudinal/cross-sectional vocabulary data in late talkers at pediatric medical fields.
