

Enabling quick response by reducing useless alerts

Abstract

- Investigating WAF alerts of cyber-attacks takes up time in security operations.
- Our technology triages alerts by determining the success or failure of attacks from packet information even if the targeted vulnerability is unknown. It improves the efficiency of security operations.

Features

- Automatically determines the success or failure of attacks by inspecting response packets.
- Uses only WAF alerts and traffic data in its determination.

Application Scenarios

- Investigating and responding to WAF alerts while monitoring customer or NTT group web servers.
